

# Fire and the Environment A Time to Reflect?’

Eur Ing Dr Jim Marsden CEng, FIFireE  
Greater Manchester Fire and Rescue Service

Fire Engineering Section  
Manchester Central

***PREVENTING PROTECTING RESPONDING***

# Introduction

- The rise in CO2 a brief overview
- Putting the problem into perspective
  - Estimated outputs from large fires
- National outputs of the FRS
- The real cost of fire
- What are the gaps?
- Where do we go from here?

***PREVENTING PROTECTING RESPONDING***

# The Issue of Global Warming

- Since the middle of the Twentieth Century, CO<sub>2</sub> levels of carbon dioxide in the Earth's atmosphere have increased at an average annual rate greater than 1 ppm per year due to a combination of natural processes and increased combustion of fossil fuels. The average CO<sub>2</sub> concentration in the atmosphere is now above 380 ppm; and the rate of increase in carbon dioxide content has increased over the past fifty years, to more than 2 ppmv annually.

# *The Issue of Global Warming*

***PREVENTING PROTECTING RESPONDING***

# Are the effects of fire a problem?

# Burning Rates and Production of CO<sub>2</sub>

- Burning rates can range from 0.035kg m<sup>-2</sup> s<sup>-1</sup> to 0.075kg m<sup>-2</sup> s<sup>-1</sup> typical
- CO<sub>2</sub> Yields can be as high as 53grams m<sup>-2</sup> s<sup>-1</sup>
- In addition to CO<sub>2</sub> other gases such as CO and compounds based on Cl<sub>x</sub> can cause damage to the environment

# The Effects of Large Fires

***PREVENTING PROTECTING RESPONDING***

# Buncefield

***PREVENTING PROTECTING RESPONDING***

# An estimation of Buncefield CO2 Rates

- The complexities of burning rates result in different yields
- In commercial combustion systems 1 litre of fuel produces approximately 3 kg of CO2
- Buncefield contained 190,000 tonnes of fuel
- Taking average density of 800kg/m<sup>3</sup>
- Approx 237 500 000 litres!
- Burned for 5 days
- Required large amounts of foam to extinguish

***PREVENTING PROTECTING RESPONDING***

# CO<sub>2</sub> Rates

Quantity Consumed	0.5kg/l	1.0kg/l	1.5kg/l	2.0kg/l	3.0kg/l	Average Tonnes
100%	118 750	237 500	356 250	475 000	712 500	380 000
80%	95 000	190 000	285 000	380 000	570 000	304 000
60%	71 250	142 500	213 750	285 000	427 500	228 000
40%	47 500	95 000	142 500	190 000	285 000	152 000
20%	23 750	47 500	71 250	95 000	142 500	76 000

***PREVENTING PROTECTING RESPONDING***

# Large Scale fires

- Buncefield
  - Total 190 000 tonnes of oil products
  - Burnt for 5 days
  - Estimated Carbon Dioxide output
  - 400,000 - 712,000 tonnes of CO<sub>2</sub>

# Large Stacks

***PREVENTING PROTECTING RESPONDING***

- Stacks can be seen as ‘Carbon Banks’
  - Wood  $C_6H_{10}O_5$  [Basic Cellulose]
  - Tyres  $C_5H_8$  [natural rubber {Isoprene}]
  - Plastic  $(C_2H_3Cl)_x$  [PVC]

***PREVENTING PROTECTING RESPONDING***

***PREVENTING PROTECTING RESPONDING***

***PREVENTING PROTECTING RESPONDING***

Stack Size m <sup>2</sup>	CO <sub>2</sub> per min (tonnes)	CO <sub>2</sub> per Hour (tonnes)
100	0.018	1.08
500	1.59	95.4
1000	3.18	190.8
10000	31.8	1908

# Grass and Wildfire

***PREVENTING PROTECTING RESPONDING***

# Grass and Wild Fire

Last week's fires in southern California broke out after the paper was written but Wiedinmyer applied the new computer model to analyze their emissions. Her preliminary estimates indicate that the fires emitted 7.9 million metric tons of carbon dioxide in just the one-week period of October 19-26, the equivalent of about 25 percent of the average monthly emissions from all fossil fuel burning throughout California.

# California Wild Fire

- 8 million metric tons of climate-warming carbon dioxide.
- In just a week
- One-quarter as much as fossil fuels do in that state in that month

Total	27501	45720	11429	22859	5741	N/A

***PREVENTING PROTECTING RESPONDING***

## The scale of CO<sub>2</sub> emissions within our community [Fire and Rescue services]

- Taking the Metropolitan brigades
  - CO<sub>2</sub> Yield annually is approximated at 300,000 tonnes
- Assuming within the rest of the brigades an annual yield of 20,000 tonnes per brigade
  - CO<sub>2</sub> yield is 1.5MT
- Total Nationally could be in the region of 2MT per year of CO<sub>2</sub>

# Estimation of CO<sub>2</sub> from stacks

Stack Size m <sup>2</sup>	CO <sub>2</sub> per min (tonnes)	CO <sub>2</sub> per Hour (tonnes)
100	0.018	1.08
500	1.59	95.4
1000	3.18	190.8
10000	31.8	1908

## Some simple concepts of Combustion

- The combustion of hydrocarbons is fairly fundamental
- Consider a simple combustion process

- But in reality

**PREVENTING PROTECTING RESPONDING**

# Environmental impacts of fires

- Usually result in large amounts of water resulting in
  - Water run off
  - Contamination
- Undesirable emissions
  - Carbon Dioxide
  - Carbon Monoxide
  - Chlorine compounds [Plastic]
  - Carbon [smoke]

***PREVENTING PROTECTING RESPONDING***

# Building Sustainability

(ARCHITECT-DESIGNED FOR GLOBAL WARMING)

***PREVENTING PROTECTING RESPONDING***

## *Factors affecting sustainability within the Built environment*

- The effects of fire on the environment are currently not taken into account within the building design.
- A sustainable building is only 'green' until it has a fire

***PREVENTING PROTECTING RESPONDING***

# *Embodied energy within Buildings*

- The ***embodied energy*** of a building is the energy used to acquire raw materials, manufacture, transport and install building products in the initial construction of a building

***PREVENTING PROTECTING RESPONDING***

# Typical Embodied energy values

Material	MJ/kg
Recycled Steel	9
Steel	32
Ree Bar	40
Concrete (poured)	1.3
Concrete (pre Cast)	2
Copper Cable	110
Aluminium	227

## However

- What about the effect of fire?
- Sustainability?

***PREVENTING PROTECTING RESPONDING***

## *The Real Carbon Footprint of fire*

- Firstly the amount of CO<sub>2</sub> produced from the construction materials used.
- Secondly the embedded Carbon released during a fire

## *The Real Carbon Footprint of fire*

- Thirdly the CO<sub>2</sub> produced for constructing a replacement building
- Fourthly the CO<sub>2</sub> produced in recycling the fire damaged materials ( i.e. steel etc)

## *The Effects of water suppression*

- An uncontrolled fire in a building will result in the release of CO<sub>2</sub> and other environment damaging chemicals
- The use of water suppression can reduce emissions to much smaller amounts

# Value of Sprinklers

## CO<sub>2</sub> Energy Calculator

CO<sub>2</sub> generated Tonnes

190.8

CO<sub>2</sub> Generated Tonnes

1.91

Benefit of sprinkler protection

188.892

# What are problems in estimating CO<sub>2</sub> production from fires

- Fire sizes are not well reported and documented
- Gas yields are very difficult to assess at large scales
- Not all fires are the same
- Not all the FRS attendance times are the same

## Further Research

- Develop a better understanding of fires within the environment.
- Development of more comprehensive carbon model.
- Greater research in combustion modelling of large scale fires

*Thank you*
